KEYWORDS

Bridge, Occupational Safety and Health, HIRADC.

ABSTRACT

Construction work includes the implementation of construction work and the community organizing the construction work itself. The implementation of this construction work must comply with the provisions regarding engineering, occupational safety and health, labor protection, and local environmental regulations to ensure the realization of an orderly implementation of construction work. The construction of the Kretek 2 Bridge in Bantul Regency, Special Region of Yogyakarta Province has its own challenges, because the location of the bridge is in an area prone to earthquakes and liquefaction or ground movement. With so many workers on this very high-risk project, there is a high probability of an accident occurring. The purpose of the study was to analyze (1) the risky work that could occur in bridge construction work, (2) the work that has the highest possible risk, (3) risk control, (4) the amount of investment costs required. The method used is the HIRADC method. The results of the study were (1) Risky work that can occur was a. High level of risk, including drowning, being dragged by the river current, being hit by heavy equipment maneuvers and falling from a height. b. Moderate risk level, including being crushed by formwork, falling material, scratched hands. c. Low level of risk, including landslides, heavy equipment maneuvers, iron puncture. (2) Work that has the highest possible risk is Pile Cap Excavation Work, Work Floor Work and Pier Head Ironing Work. (3) Risk control in bridge work consists of: Using a boat when measuring in rivers, Conducting briefings before starting activities, Using PPE life vests and placing life ring buoys on boats, Installing signs and placing officers in areas that intersect with roads, Installing guardrail of the project area, installing scaffolding as a working platform and inspecting its feasibility, communicating hazards through signs, conducting refresh training for workers. (4) The investment cost required for implementing K3 on the Kretek 2 Bridge work in Bantul Regency was Rp. 6,545,998,310 or 1.795% of the contract value.

INTRODUCTION

Indonesia is one of the developing countries, development and development in the construction sector have increased. The Ministry of Public Works and Public Housing (PUPR) through the Directorate General of Wildlife Development is completing the construction of the Kretek 2 Bridge located in Bantul, Yogyakarta Special Region (DIY). The bridge with a total length of 2.01 km spans the Opak River and connects Tirtohargo Village with Parangtritis Village. This bridge is part of the 1,604 km Long Java South Coast Road which is famous for its coastal tourism area that stretches from Banten to East Java.

The construction of the Kretek 2 Bridge has its own challenges because the location of the bridge is in an area prone to earthquakes and liquefaction or soil movement. With

a lot of workers on the project that can be said to be very high-risk, it is not impossible to the possible risk of accidents. In accordance with the requirements of OHSAS 18001, organizations must obtain procedures regarding hazard identification, risk assessment, and determining control or HIRADC for short. This whole process is called risk management. HIRADC is a method used to identify and analyze potential hazards and provide risk assessments that will later be considered regarding the level of danger.

To find out more about the risk of accidents or dangers that will occur and the level of possibility, research is needed that aims to:

1. Analyzing risky work, 2. Analyze the work that has the highest possible risk, 3. Analyzing ways of risk control, 4. Analyzing the large investment costs required for the application of K3 on the Kretek 2 Bridge work in Bantul Regency

RESEARCH METHOD

Occupational Health and Safety (K3)

Occupational Safety and Health (K3) is a condition or factor that affects or may affect the health and safety of workers or other workers (including temporary workers and contractors), visitors, or any person in the workplace. (Ramli, 2013) Risk

Risk can be associated with the possibility of unintended adverse consequences or uncertainty. This is a condition that causes the growth of risks stemming from various activities and may affect the cost, schedule and quality of projects (Darmawi, 2008) Danger

Danger is a source, situation, or action that could potentially cause human accidents or injuries, damage, or other disturbances. According to Ramli (2010) hazards come from the following five factors: 1.Mechanical Hazard, 2.Electrical Hazard, 3.Physical Hazard, 4.Biological Hazard, 5.Chemical Hazard. Work Accidents

According to the Decree of the Director General of Industrial Relations Development and Manpower Supervision Number 84 of 1998 states that the sources and types of accidents are as follows: 1.Sources of work accidents, 2. Types of accidents HIRADC (Hazard Identification, Risk Assessment and Determining Control)

Ministerial Regulation Number 21/PRT/M/2019 article 3 paragraph 1 states "Every service user and service provider in the implementation of construction services must apply SMKK". Identifying hazards, conducting risk assessments, and conducting risk control are important requirements in the implementation of SMKK. Data Analysis Techniques

Determination of Respondent Sample

The determination of the sample of respondents used is intentional sampling

or purposive sampling (Andriani, 2017). Purposive sampling is sampling whose sample members are selected intentionally based on respondents' knowledge of the risks of implementing K3 work on Kretek Bridge 2 in Bantul Regency.

RESULT AND DISCUSSION

Probability Analysis

Probability is a measure of the likelihood that a future event will occur. Probability only has a value between 0 and 1. The scale used for this method uses a likert scale, with a range of numbers 1-5 as in the following table:

 Table 1 Possibilities with a Likert Scale

	Measurem		Criterion
	ents with		
	Likert	Quantitati	
Information	Scale	ve Criteria	Qualitative Criteria
Very Rare	1	≤ 20	Less occurrence, only under
			certain conditions
Sometimes It	2	21-40	Sometimes occurs in conditions
Happens			certain
May Happen	3	41-60	Occurs under certain conditions
Frequent	4	61-80	Frequent occurrence of every
-			condition
Almost Certainly	5	81-100	Always happens in every
Happened			condition
C))		

Source: Ramli (2013)

2. Impact Analysis with Likert Scale

Impact is an event that exerts an influence, both adverse and beneficial influence. The impact in question is something that will be received or obtained by individual accident victims or companies communally.

	Measureme		Criterion									
	nts with	Quantitativ										
Information	Likert Scale	e Criteria	Qualitative Criteria									
Insignificant	1	≤ 20	Not so significant losses, minor									
_			injuries (bad influences can be									
			ignored)									
Small	2	21-40	Minor injuries; Requires P3K									
			treatment (directly can be									
			handled at the scene); moderate									
			material losses.									
Keep	3	41-60	Moderate injuries; Loss of									
			working days; Requires medical									
			treatment; Material losses are									
			considerable									
Heavy	4	61-80	Major injuries; Defects result in									
			defects or complete loss of body									
			function, large material losses.									
Disaster	5	81-100	Death, huge material losses									

Table 2 Impact with a Likert Scale

Source: Ramli (2013)

3. Severity Index Analysis

The severity index is used to determine the significant risks to both items, namely probability and impact. Severity index is calculated using the equation *Severity Index* Formula for *Probability*:

$$SI(p) = \frac{\sum_{i=1}^{5} a_i x_i}{\sum_{i=1}^{5} x_i} (100\%)$$
(1)

where:

<u>http://devotion.greenvest.co.id</u> | Isyraq Nashrullah Arifin, Wateno Oetomo, Laksono Djoko Nugroho SI(p)= *Severity Index* for *Probability*

= Assessment constant a

= Respondent Frequency Xi

i= 1, 2, 3, 4, 5,... n

x₁, x₂, x₃, x₄, x₅ are respondents' frequency responses

 $x_{1=}$ Frequency of respondents "Very Rare," then $a_1=1$

= Frequency of respondents "Sometimes It Happens," then a 2 = 2 X_2

= Respondent frequency "May Occur," then a 3 = 3X3

= Frequency of respondents "Frequent Occurrence," then $a_4 = 4$ X_4

= Respondent frequency "Almost Certainly Happens," then a 5 = 5X5 Severity Index Formula for Impact:

$$SI(i) = \frac{\sum_{i=1}^{5} a_i x_i}{\sum_{i=1}^{5} x_i} (100\%)$$
(2)

where:

SI(i)= Severity Index for Impact

= Assessment constant ai

= Respondent Frequency Xi

i= 1, 2, 3, 4, 5..., n

x₁, x₂, x₃, x₄, x₅ are respondents' frequency responses

 x_{1} = Frequency of respondents "Insignificant," then $a_1 = 1$

= Frequency of respondents "Small," then $a_2 = 2$ X_2

= Frequency of respondents "Moderate," then $a_3 = 3$ X3

= Frequency of respondents "Weight," then $a_4 = 4$ X_4

= Frequency of respondents "Disaster," then a 5 = 5X5

4. Assessment of Employment Risk Level

After obtaining the results of the Severity Index and the level of classification, the matrix value is obtained in accordance with the provisions that have been applied as follows:

	augui y ma	
Category	SI (%)	Possible Matrix Level
Almost Certainly	81-100	5
Happened		
Frequent	61-80	4
May Happen	41-60	3
Sometimes It Happens	21-40	2
Very Rare	≤ 20	1
Sol	Irca. Damli	(2013)

Table 3 Category Matrix Possibilities

Source:	капш	(2013)	

Table 4 Impact Matrix Categories											
Category	SI (%)	Impact Matrix Level									
Disaster	81-100	5									
Heavy	61-80	4									
Keep	41-60	3									
Small	21-40	2									

Isyraq Nashrullah Arifin, Wateno Oetomo, Laksono Djoko Nugroho | http://devotion.greenvest.co.id

Category	SI (%)	Impact Matrix Level
Insignificant	≤20	1
	~ -	

Source: Ramli (2013)

Once converted into probability and impact matrix levels, the two values are multiplied to plot on the matrix, so that they will get the risk level. The risk level in question is the level of risk obtained from the calculation of the probability that will occur and the amount of influence that will be received. The purpose of this probability and impact matrix is to find out which risks are likely to occur and have a big impact on the project with the scale used is a matrix of values 1-25.

To find out the measure of risk, probability and impact can be plotted in a risk matrix, using the equation:

R = P x I (3) where: R : Leveling Risk

P : Probability

I: Impact

The result of the matrix is to determine the risk level from each identification of possible risks that can occur. Then from the known risk level, it will also be taken into account in planning its handling on the risk response.

Determining Control

The next stage is to determine the controls used to reduce or eliminate the impact of the risk of imminent harm in a project. Control is carried out based on five levels as follows:

1. Elimination

The method of elimination is a method of risk control that if possible should eliminate or completely remove processes or materials that may cause the presence of harm

2. Substitution

The substitution method is a method of controlling hazards by replacing work or tools with others that have less danger

- 3. Engineering Control Methods of hazard control that protect workers from hazards such as providing the placement of materials, materials, signs, checking tools and maintenance of tools and materials to be used
- 4. Administrative (Administrative) Control of risks and hazards in the form of regulations related to occupational safety and health made such as conducting periodic K3 inspections, toolbox meetings, conducting training, safety morning, SOPs and supervision
- 5.Personal Protective Equiepment (PPE) The most recent hazard control is to use personal protective equipment or PPE. This latest hazard control is less effective but must be done for smooth running and safety of work on the condition that you use complete personal protective equipment to minimize workers from being injured

Develop HIRADC (Hazard Identification, Risk Assessment and Determining Control)

After collecting various data from hazard identification, risk level assessment and risk control, then compiling a HIRADC able which will be used to determine the value of the risk level of danger that occurs in the bridge pillar structure work as a research object. In able HIRADC made more detailed along with the implementation method to get more detailed results. 378378378378

Investment Costs of K3 Implementation

After observation of the application of K3 control, then the calculation of the investment cost needs of the occupational safety and health management system (SMK3) was carried out based on the Circular Letter of the Minister of Public Works Number: 66 / SE / M / 2015, concerning investment costs for the Implementation of the K3 Construction System in the Field of Public Works.

The investment costs required for theimplementation of K3 on the Kretek 2 Bridge work in Bantul Regency include:

1. RKK Setup

- 2. Socialization, Promotion and training
- 3. Work Protective Equipment and Personal Protective Equipment
- 4. Insurance and Licensing
- 5. Construction Safety Personnel
- 6. Health facilities and infrastructure
- 7. Health Programs
- 8. Prevention of Covid-19
- 9. Handling Covid-19
- 10. Signs
- 11. Consultation with a Construction Safety expert
- 12. Miscellaneous Related to K3 Risk Control
- 13. Industrial Hygiene and Environmental Monitoring
- 14. General and Operational

ANALYSIS

Results of Identification of Risky Work

The risk identification stage is based on the *standard of procedure* (SOP) of each job. Starting from the implementation stage, the tools used, and the materials used.

	Table 5 Results of Identification of Risky Work												
No.	Jobs at Risk	Danger											
1	Pile Cap Excavation Work

Table 4 shows the results of the identification of the Risk of Kretek Bridge Construction 2 in Bantul Regency, which consists of 9 occupational risks, namely (1) pile cap excavation work, (2) Work floor work, (3) Pile cap fixing work, (4) Pillar cleaning work, (5) Pier head fixing work, (6) Iron fabrication work, (7) Foundry work, (8) Formwork installation work and (9) Formwork demolition work.

Results of the Identification of Risky Work Questionnaire

The assessment was given by 20 respondents who had been determined based on the experience and thoughts of each respondent.

Grouping of Employment Risk Levels

Grouping of Employment Risk Levels

Based on the assessment of the risk level for each work, the project on the Kretek 2 Bridge construction project in Bantul Regency obtained a grouping of high to low risk levels for each work as follows:

Table 24 Grouping of Employment Risk Levels									
	Work			Level	Level				
-			Level	Impa	Risk				
			Prob.	ct	(P x				
No	Job Risk	Job Risk	(P)	(I)	I)				
1		Pile Cap Excavation Work							
	Tall	Drowning dragged by the current	3	4	12				
_		of the river

Source: Data processing results

Based on the grouping of occupational risk levels, the construction of Kretek Bridge 2 in Bantul Regency obtained 3 (three) high job risks, 12 (twelve) medium occupational risks and 9 (nine) low job risks.

Risk Control and Preparation of HIRADC

The next stage is to determine the control and preparation of the HIRADC table used to reduce or eliminate the impact of the risk of hazards that will occur on the nine bridge pillar structure works in the Kretek 2 Bantul Bridge Construction, as follows:

CONCLUSION

Based on the objectives of the study, it can be concluded that:

The risky work that can occur in the construction of the Kretek Bridge 2 pillar structure in Bantul Regency is as follows:

High risk levels include: 1. Drowning dragged by river currents, 2. Exposed to machine maneuvers and 3. Dropped from a height

Moderate risk levels include: 1. Being crushed by formwork, 2. Falling material, 3. Scratched hand, 4. Pinched hand, 5. Hand hit by hammer, 6. Fingers of hand cut gear, 7. Electrocuted, 8. Mired mixer truck, 9. Concrete pump mired and rolled over, 10. Mired, 11. Danger from the attack of a poisonous animal and 12. Struck by lightning

Low risk levels include: 1. Landslides, 2. Maneuvering heavy equipment, 3. Punctured iron, 4. Exposed to manual work tools, 5. Crushed tools and materials, 6. Hand pinched formwork, 7. Exposed to manual work tools, 8. Exposed to flakes of iron material and 9. Respiratory disorders

In the implementation of construction, works that have a high potential risk are: 1. Pile Cap Excavation Work, 2. Work Floor Work and 3. Pier Head's Fixing Work.

Risk control on the work of Kretek 2 Bridge in Bantul Regency is as follows:

Control of the risk of drowning dragged by river currents in pile cap excavation work, consisting of: 1. Use of boats when measuring on the river, 2. Conduct briefings before starting activities and 3. Using PPE life vest and placing life ring buoy on the boat

Control of the risk of being exposed to machine maneuvers on work floor work, consisting of: 1. Installation of signs and placement of officers in areas that intersect with the highway and 2. Installation of project area guardrails

Control of the risk of falling from a height on pier head cleaning work, consisting of: 1. Installing the scaffolding as a working platform and inspecting its airworthiness and 2. Hazard communication through signs, 3. Refresh training for workers

The investment cost required for the application of K3 on the Kretek 2 Bridge work in Bantul Regency amounted to Rp 6,545,998,310 (six billion five hundred and forty-five million nine hundred ninety-eight thousand three hundred and ten rupiah) or 1.795% of the contract value of Rp 364,627,810,221, in accordance with the Regulation of the Minister of Public Works Number: 05/PRT/M/2014, which includes:

The implementation of construction with high and low hazard potential must involve a construction K3 Expert (Article 6 of the Pu Regulation Number: 05 / PRT / M / 2014)

The cost of organizing SMK3 Construction PU Field is allocated in general costs which include: a. RKK Preparation, b. Socialization, Promotion and training, c. Work Protective Equipment and Personal Protective Equipment, d. Insurance and Licensing, e. Construction Safety Personnel, f. Health Facilities and infrastructure, g. Health Programs, h. Prevention of Covid-19, i. Handling of Covid-19 (SE No. 443/5283 of 2021), j. Signs, k. Consultation with experts related to Construction Safety, l. Miscellaneous Related to K3 Risk Control, m. Industrial Hygiene, Environmental Management and Monitoring and n. General and Operational (Article 20 of the Pu Regulation Number: 05/PRT/M/2014)

Hazard Identification, Risk Assessment, Priority Scale, K3 Risk Control (Appendix to Pu Regulation Number: 05/PRT/M/2014).
